PROFILE SUMMARY

Aspiring DevOps Engineer with hands-on experience building CI/CD pipelines, automating cloud infrastructure, and developing internal tooling using Jenkins, Docker, Kubernetes, ArgoCD, Terraform, and Ansible. Skilled in Infrastructure as Code, GitOps workflows, and Python-based automation, with 3 self-driven projects demonstrating end-to-end deployment, provisioning, and monitoring capabilities. Seeking to bring a strong foundation in Linux and cloud-native tools to a product-based engineering team.

EDUCATION

Stewart Science Degree College (Utkal University)

Cuttack, Odisha

Bachelor of Science in Computer Science

2022-2025

- Presented a technical seminar on Cloud Computing at the College Seminar Fest.
- Graduated with a CGPA of 8.50/10 in B.Sc. Computer Science.
- Top 10% in Academics.

SKILLS

Technical skills: Containerization & Orchestration, API Development, Scripting & Automation, IaC, Cloud Deployment

Tools: Python, Linux, AWS, SQL, Docker, Kubernetes, Jenkins CI/CD, Git, GitHub Actions, Terraform, Ansible, Gitlab, Jira, Slack

PROJECTS

CI/CD Pipeline with Jenkins, Docker and ArgoCD (GitOps)

- Automated the build-to-deployment lifecycle in Jenkins, triggering Docker image builds and pushes to Docker Hub on every GitHub commit
- Implemented a GitOps-based delivery workflow using ArgoCD to continuously sync Kubernetes cluster state with the Git repository
- Authored 3 Kubernetes manifests (Deployment, Service, ConfigMap) and validated rollout/rollback behavior across multiple deployment cycles using kubectl

Infrastructure Automation with Terraform and Ansible

- Provisioned 3 categories of AWS infrastructure — EC2 instances, S3 buckets, IAM roles — using Terraform, with remote state managed via an S3 backend
- Automated post-provisioning configuration across multiple Linux hosts using Ansible playbooks, covering package installs, service setup, and user management
- Combined both tools into a single provisioning-to-configuration pipeline, collapsing manual multi-step setup into one automated run

Internal DevOps Utilities API — System Health & AWS S3 Monitoring

- Developed a modular REST API with a router/service-layer architecture, exposing 2 core endpoints with interactive Swagger/ReDoc documentation
- Built a health-check endpoint tracking 3 live system metrics CPU, Memory, Disk usage with configurable threshold-based status classification
- Built an S3 monitoring endpoint using Boto3 to inventory buckets and flag entries against a 90-day age threshold for lifecycle decisions
